

Sefar Textile screens can be ordered with a coating of emulsion and arrive ready to image. Customers can choose from standard or high density coating thicknesses. Coating is available on all frame sizes.

Coated screens arrive at the customer site in individually bagged, light-safe containers. Only remove screens from the bags under safe lighting conditions.

Emulsion Textile Coatings

Standard Emulsion Coating

The standard coating on our textile screens is a high-resolution dual cure that has an EOM that is targeted to be approximately 10-15% of the mesh thickness.

High-Density Emulsion Coating

The high-density coating on our textile screens is a photopolymer that is applied using a coating machine to insure coating accuracy and consistency. The targeted EOM is 270 microns, however, other thicknesses can be requested. Please talk to your local Sefar Representative to learn more about our HD coating options.
